

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph [329] (which bridges pages 103-104 of the originally-submitted application) with the following amended paragraph:

[0329] The process begins by receiving a batch request at a server (step 952); the batch request contains multiple fragment requests, which are then processed in turn. A next fragment request is retrieved from the batch request message (step 954) and executed (step 956), which presumably includes generating the fragment, after which the fragment may optionally need to be formatted or tagged for transmittal (step 958), although the fragment may have been previously cached at the server. A determination is made as to whether or not there is another fragment request in the batch request message (step 960), and if so, then the process branches in order to process another fragment request. Otherwise, a multi-part MIME response message with all requested fragments is generated (step 962), and the response message is returned (step 964), thereby completing the process.
